STATES COLUMN NUSSELLA RESULUTIONES

in estimating Seviet missile requirements, we have proceeded on the basile of two general appropriates: 1) that there will be no international agreement on control of exter space or limitation of armsents, and 2) that the USS would plan for general war even though it has no intention of initiating general war and colliberately avoids courses of action which incar grave risk of leading to general war.

The first assemblen buller that the USE will not be restrained by treaty colligations in devaloping, producing, or introducing into operational units any missile systems which it regards as necessary or desirable for the achievement of Soviet objectives. The second essention, which is consistent with our estimates of likely Seviet courses of section in the next five years, implies that the USE would establish missile requirements for general war, but does not imply that it would go beyond the design and feesibility stage for any particular mismle system considered by Soviet military planners or for all missile systems which they decide are required. Some missile systems will cortainly be developed beyond the stage of fessibility tests, produced in quantity, and introduced into operational units. But which ones will be pushed and how for the FIR will attempt to go in any particular category of misciles depends on Soviet technical and economic capabilities, the relative pricrity of competing desends on those capabilities, and the strategy adopted to carry out their intentiors.

In regard to Soviet capabilities, we have tempered our judgment of missile requirements by taking account of the present and prospective state of the art in missile and space technology. However, we have not explicitly eliminated any requirement on the grounds that it cannot be not by a certain time or curing the period of this estimate. The controlling factor is the nature and time-phase of the Western throat as seem by the USE, not Seviet technical capabilities. The latter is held in absymmes. Consequently, some of the estimated requirements might be beyond Seviet capabilities during the period 1958-1966, while others might be within their technical capabilities but not attainable soon enough to meet the threat. Similarly, concerns limitations might prevent the USE from preducing certain missiles or associated equipment in might for this reason.

during the period 1998-1966 is largely determined by the priority assigned to the task. There are, of course, outside limits to Sowiet capabilities—not only in the obvious sense that the technical and economic resources of the Task at any given time are finite, but more importantly in the sense that providing such resources beyonk a certain point yields diminishing returns and may actually retard the attainment of the objective in question. For example, the research and development effort on a given missile can

personnel are assigned to the project. Althin these bread limits, becomes, the capabilities of the USE depend on how it allocates its recourses and hence on the relative priority of competing deserts.

he believe that the USA has given very high priority to its missile program, but recognise that not all miscale systems have been or will be assigned equal pricelty. From the evidence to date, it eppears that the development of a surface-to-air missile system (such as that around Moscow) was initially regarded as the most urgant requirement and that the development of law-range mariace-to-extince ballistic missiles was considered to be equal, or nearly equal, in priority. At the present time the ICE probably has prester priority than any other missile system, since 1) challensive missible systems are not being put into operational use with the mess degree of urganey that characterized the octabilidement of the surfaceto-mir missile complex around Poscow, 2) there is no owidence of increased priority being assigned to air-to-surface missiles, and 3) substantial progress on the development of surface-to-surface ballietic missiles with ranges up to 1000 a.m. has already bean made. It is reasonable to expect that highest priority will continue to be given to the ICEN until prototypes are introduced into operational units. Depond that point, the relative priority between missiles and other weapon systems and between the various types and categories of minsiles themselves is very uncertain.

1

These previsional judgments concerning relative priority will be aligneted by the subsequent assessment of devict technical and economic capabilities, particularly by the estimated wands in those resources which determine future capabilities. They will also be affected by abatever estimates, techt or otherwise, are made of devict strategy—particularly the extent to shich the Dos stresses the concept of a deterrent force and intends to use the INTH principly as a political threat. Accordingly, the missile requirements outlined below, even if they are all within Soviet espabilities, do not necessarily indicate the most probable assertment of missiles that the USS will develop and probable
